VI Schedule Overview 44

Front Cover – – The NASA/ESA/CSA James Webb Space Telescope has observed the well-known Ring Nebula with unprecedented detail. Formed by a star throwing off its outer layers as it runs out of fuel, the Ring Nebula is an archetypal planetary nebula. Also known as M57 and NGC 6720, it is both relatively close to Earth at roughly 2,500 light-years away. There are some 20,000 dense globules in the nebula, which are rich in molecular hydrogen. In contrast, the inner region shows very hot gas. ***Photo Credit: ESA/Webb, NASA, CSA, M. Barlow, N. Cox, R. Wesson***.

Java Jam

Link up with colleagues and refresh for the late afternoon sessions with hot coffee, tea, or cocoa at the Java Jam in the Grand Atrium. (See Floor Plan of the Conference Venue on page 5.)

Fireside Cheer and Chat

When the evening's sessions are over, it's time to wind down with some camaraderie next to the fireplace in the Sunken Lounge. (See Floor Plan of the Conference Venue on page 5.) Have a bowl of ice cream with toppings, a cup of coffee or tea, and relaxing conversation with friends to prepare for a great night's sleep in the Rockies.

Electronic Presentation Hall (EPH)

EPH presentations are available to attendees through our website (https://aeroconf.org/eph_papers) throughout the conference week.

Presentation Workshop

This free workshop, conducted by Caltech (see schedule for time and location) can help technical professionals improve their presentation skills, conveying technical concepts clearly, persuasively, and memorably. Participants will gain practical skills for ensuring their presentations captivate and resonate with diverse stakeholders. You must sign up on the conference bulletin board.

Exhibits

Exhibit booths are set up along the corridor in the Lower Atrium and in the Upper Atrium. (See the Floor Plan of the Conference Venue on page 5 and the Exhibitor Map on page 41.) Come check out our exhibitor displays and chat with the exhibitor reps about their offerings!

Junior Engineering & Science Conference

The Junior Conference is our forum for students in first grade through high school. They present technical papers on their ideas, reasoning, field work, research, experiments, inventions, or topical surveys. Come be amazed by the quality, originality and inquisitiveness of these kids. One session this year, Tuesday 1:15-4:30 in the Madison Room.

Farewell Party

It's Friday night. The last paper has been given; the final panel has concluded. Sponsors have closed their exhibits. You've turned in your Evaluation Forms and perhaps volunteered for a role in the 2027 Conference. It's time to say goodbye to colleagues new and old at our final gala Farewell Party. The buffet dinner begins at 7:00 pm upstairs in the Mountain Mall. **See you there!**

Badges must be worn at all events!

The Dark Oxygen Research Initiative (DORI) Project - Investigating Dark Oxygen Production in the Deep Sea

Andrew K. Sweetman, The Scottish Association for Marine Science, (SAMS), Oban, UK

Deep-sea seafloor organisms consume oxygen as part of a global balance between photosynthesis and respiration, but direct observations of oxygen consumption rates from the abyssal seafloor are scarce relative to its areal extent and the diversity of seafloor habitats. In 2024, Sweetman et al. published research from in-situ seafloor incubations from previously unexplored manganese nodule provinces in the eastern equatorial Pacific Ocean, where they found more oxygen was being produced at the abyssal seafloor than was being consumed. In >40 incubations of the seafloor, they found oxygen levels increased in 93% of their enclosed chamber experiments, rising to more than 3-times background levels over 48 hours. Dark Oxygen Production (DOP) occurred exclusively in the presence of manganese oxides. It is presently unclear what the mechanism behind DOP is, but the close link to polymetallic oxides and increase in interest in deep-sea mining necessitates further investigations. With funding provided by the Nippon Foundation, SAMS is embarking on a multi-year research program to fully characterize DOP in different deep-sea habitats and developing the Dark Oxygen Research Initiative - the DORI project. This talk will showcase the extensive evidence for DOP as well as provide details on the DORI project.

The Quiet Part: Remote Sensing and Earthquake Strain Accumulation

Andrea Donnellan, Purdue University, West Lafayette, Indiana

Earthquakes often strike without notice and can be severe, causing billions of dollars damage. The process leading to earthquakes is primarily driven by plate tectonics, inexorably occurring over millions of years. Tectonic motion causes strain to accumulate, which releases as earthquakes or quietly as aseismic motion. Aseismic or quiet motion occurs during elastic strain accumulation, along weak faults, or in compliant rock units or sediment. Remote sensing offers a means of measuring both aseismic and seismic surface displacements and deformation. Techniques include Interferometric Synthetic Aperture Radar (InSAR), which measures line of sight changes between pixels on the ground and the instrument, and Global Navigation Satellite System (GNSS), which provides detailed time series of GNSS stations. Lidar and optical imagery reveal the topographic expression of faults and surface displacements produced by earthquakes. These remotely sensed measurements complement seismic and geologic observations of earthquakes and faults, allowing a more complete view of the earthquake cycle and evolution of faults over time. Understanding the quiet part of earthquake cycles better bounds earthquake hazard assessment by partitioning how much tectonic motion occurs seismically or leaks out of the system aseismically.

Early Results from the SPHEREx Spectral Survey Satellite

James Bock, California Institute of Technology and NASA Jet Propulsion Laboratory, Pasadena, CA

SPHEREx, a satellite in NASA's Medium Explorer program, launched in March 2025. The mission is now observing the entire sky in infrared spectroscopy, the first survey of its kind. SPHEREx is designed to probe the exotic physics of inflation, study the origin of water and biogenic molecules in the form of ices in interstellar space, and chart the origin and history of galaxy formation. SPHEREx is producing four allsky spectral maps in 102 infrared colors that will serve as a rich archive for the astronomy community. With over a billion detected galaxies, hundreds of millions of high-quality stellar and galactic spectra, and over a million ice absorption spectra, the archive enables diverse scientific investigations across astronomy. This talk will describe the SPHEREx science goals and present some early results.

The Cosmos We Take For Granted

Matthew Strassler, Harvard University, Cambridge, MA

In our busy 21st century, it is easy for many days to pass without our thinking even once about the universe we inhabit. Our senses and brains lull us into complacency, concealing how the cosmos permeates and shapes our lives. But when the most basic features of the world are examined closely, puzzles arise that reveal the universe's profound strangeness. These puzzles are simple to state and yet, despite the best efforts of physicists, they have proven extraordinarily difficult to resolve.

1177 BC and After: Solar Minimums, Rapid Climate Changes, and the Collapse of Bronze Age Civilizations

Eric Cline, George Washington University, Washington, D.C

Blame for the end of the Late Bronze Age in the Aegean and Eastern Mediterranean is usually laid squarely at the feet of the socalled Sea Peoples, known to us from the records of the Egyptian pharaohs Merneptah and Ramses III. However, while the Sea Peoples may well have been responsible for some of the destruction that occurred, it is much more likely that a concatenation of events, both human and natural — including earthquake storms, droughts, rebellions, and systems collapse, caused in part by a solar minimum and a Rapid Climate Change — coalesced to create a "perfect storm" that brought the age to a sudden and unexpected end. Furthermore, while the centuries following the Late Bronze Age Collapse in the Aegean and Eastern Mediterranean were indeed a time of catastrophe, they were also a time of rebirth and resilience — it was less of a Dark Age and more of a reboot for many of the societies which were affected. While there are examples of failure to thrive or even to survive in some cases, others managed to adapt and transform, even standardizing the alphabet and making the switch from bronze to iron. In effect, we have eight case studies of what to do (and what not to do) in the event of a systems collapse, ranging from the Assyrians, Babylonians, and Egyptians to the Mycenaeans, Cypriots, Phoenicians, and others in between.

How the Languages We Speak Shape the Ways We Think

Lera Boroditsky, University of California San Diego, San Diego, CA

Humans communicate with one another using 7,000 or so different languages, and each language differs from the next in innumerable ways. How do the languages we speak shape the ways we think? This presentation will discuss research conducted around the world showing how language fundamentally structures the way we think about color, space, time, causality, and agency.

The Unbearable Slowness of Being: Why Do We Live at 10 Bits per Second?

Dr. Markus Meister California Institute of Technology, Pasadena, CA

This talk is about a conundrum around the slowness of human behavior. The information throughput of a human being is about 10 bits per second. In comparison, our sensory systems gather data at a billion bits per second. The stark contrast between these numbers remains unexplained and touches on fundamental aspects of brain function: What brain circuits set this speed limit on the pace of our existence? Why does the brain need billions of neurons to process a paltry 10 bits per second? Why can we only think about one thing at a time? The answers promise a new perspective on human behavior and cognition, as well as our future relationships with thinking machines.

Fishing for Invasive Lake Trout with Airborne Lidar

Joseph Shaw, Montana State University, Bozeman, Montana

The 1994 discovery of non-native lake trout in Yellowstone Lake at the southeast corner of Yellowstone National Park launched a struggle to preserve the Yellowstone ecosystem. Lake trout eat the prized native cutthroat trout but live far too deep to fill the cutthroat trout role as primary protein source for animals that include bears, pelicans, and otters. When fisheries biologists needed information on where the lake trout spawn, Montana State University lidar researchers developed a custom airborne lidar ("laser radar") system to fly in a small airplane and hunt for laser scattering signatures to reveal lake trout spawning locations. Manual examination of lidar data successfully identified previously unknown spawning sites and machine learning methods have been developed recently to automate the analysis. This presentation will tell the story of how a university-based optical scientist led the development and refinement of airborne lidar methods that are contributing to saving the Yellowstone ecosystem where his ancestors more than a century before ran one of the first camping companies in the newly established Yellowstone National Park.

About the Prognostics and Health Management Society

The Prognostics and Health Management (PHM) Society is a professional organization dedicated to the advancement of PHM as an engineering discipline. The PHM Society was incorporated in 2009 as a non-profit organization dedicated to the advancement of all things PHM and their related technology disciplines, across appropriate industry sectors, and applications. The flagship events of the society are our annual conference events and their diverse offerings. Current the society has over 7,000 participating members across over 30 countries. More information and content can be found on our website is: phmsociety.org

The Prognostics and Health Management Society is dedicated to:

- promoting the development, growth, and recognition of prognostics and health management (PHM) as an engineering discipline;
- supporting PHM education by developing standard teaching curricula in the field;
- participating in and facilitating international scientific collaboration in connection with the advancement or application of PHM;
- advancing the theory and practice of PHM;
- establishing, presenting, managing, or organizing PHM conferences, workshops, seminars, and courses;
- publishing peer-reviewed publications concerning or related to PHM and its applications; and
